Cybersecurity Basics for Students

Original educational sample document for the Ask-Your-PDFs RAG project.

Passwords and multifactor authentication

Use long, unique passwords for each account and consider a reputable password manager. Multifactor authentication (MFA) adds an additional verification step beyond a password. Do not share one-time login codes with other people.

Phishing awareness

Phishing messages may imitate a school, bank, or delivery company to trick recipients into revealing information. Check the sender, inspect URLs, and avoid opening unexpected attachments. When in doubt, visit the organization website directly rather than clicking the message link.

Updates and backups

Keep operating systems, browsers, and applications updated. Install software from trusted sources. Maintain backups of important schoolwork in a separate location or reliable cloud service, and periodically test that files can be restored.
